

How to download project through HMI name

If users would like to download project through Ethernet, there are two ways for selection. One is to input HMI IP address for downloading; another is to input HMI name. Before downloading project through Ethernet, the IP address of target (HMI) must be set correctly in system settings in HMI. If "Auto Get IP Address" is selected, IP address will be automatically assigned from local DHCP network. While if "IP address get from below" is selected, IP address and other network information have to be inputted.
